

India's government passed battery waste management rules in 2022 that mandate environmentally safe disposal and management of battery waste. But given the largely informal nature of scrap recycling in ...

What started in a workshop is now one of India's few operational facilities capable of handling end-to-end battery recycling. At the heart of RecycleKaro's model is a belief that technology ...

Battery Recycling Jobs: India is on the brink of a battery recycling revolution that promises to create 100,000 green jobs while securing key minerals like lithium, cobalt, and nickel, ...

India's battery recycling startups are pioneering solutions that address both environmental imperatives and economic opportunities.

India's lithium-ion battery recycling and second-life facility expansion stems from several converging market forces that create compelling investment opportunities. The country's electric ...

Recognizing these challenges, top EV battery recycling companies have stepped up operations, addressing the crucial demand for sustainable solutions in the face of growing battery ...

By embedding recycling into the National Critical Mineral Mission, India can secure its raw material supply, reduce import bills, create green jobs, and emerge as a global hub for circular ...

India currently has 60,000 tons of battery recycling capacity, but not all of it is used because supply chains are still being developed to supply the recovered materials to factories.

Battery recycling in India is essential from environmental, ecological and economical perspectives.

India, with its booming EV adoption, solar expansion, and digital lifestyle, is generating battery waste faster than it can process it. But inside every discarded battery lies a reservoir of ...
