

What is a power generating station?

A power generating station (also called a power plant or power station) is an industrial facility that converts primary energy --such as chemical energy in fuels, nuclear energy, or kinetic/thermal energy from nature--into electrical energy. The output is synchronized with the grid, stepped up in voltage, and transmitted to consumers.

Does a generating station generate electricity?

A generating station creates electricity. A substation conditions and routes electricity--stepping voltage up or down,switching circuits,and providing protection--but does not generate power. Why do most plants generate AC instead of DC?

What is a power station?

Saiful Hasmady bin Abu Hassan A power station (also called a generating station,powerhouse,generating plant,or power plant) refers to industrial equipment for electric power generation. The classification of TPPs is normally based on the fuel type,types of the thermodynamic cycle,as well as the type of installed prime mover [31,32].

How does a generator work?

The generator is the fundamental component of every power-generating system; it converts mechanical energy into electrical energy. In alternating current generators,or alternators,a coil is positioned in a stationary magnetic field and rotates clockwise because of external mechanical torque.

The stator bar, as the component connecting the coils in the generator to the external circuit, is the main carrier of current and electric field. It is hailed as the "heart" of the generator and ...
