

Great Britain has broken the maximum wind generation record by producing enough wind to power over 23 million homes across the country. On 5 December at 5:30pm, wind generated ...

This chapter comprehensively discusses wind power generation, tracing its evolution from historical windmills to modern large-scale wind farms, and analyzing its technical principles, resource ...

Using an Original Institutional Economics (OIE) approach to examine real world developments, we argue that the global wind energy industry is increasingly volatile and ...

A typical large wind turbine can generate up to 1.8 MW of electricity, or 5.2 million KWh annually, under ideal conditions--enough to power nearly 600 households. Still, nuclear and coal power plants can ...

Britain generated more wind power in January than in any month on record, as a succession of severe storms pushed turbines to produce 10.6TWh of electricity, analysis shows.

Although our review does not address social acceptance per se, it delivers a crucial knowledge basis by providing a summary of research about evidenced impacts of wind power, ...

The National Energy System Operator (NESO) has announced that Great Britain has set a new maximum wind generation record on 11 November 2025, generating 22,711MW of electricity - ...

It broke the industry world record for maximum launch height of a floating wind power system, as well as for maximum power generation by a single airship, reported Science and ...

The extra layer of scrutiny for wind and solar contrasts with actions by the Trump administration to make it easier and cheaper for companies to produce oil, coal, gas and nuclear power.

This Special Issue aims to present state-of-the-art research on data-driven solutions and integrated approaches to wind power generation and utilization. We invite contributions that address ...
